in this title originally published in 1984 wilman develops and describes a methodology for imputing a monetary value to the loss in beach recreational services that would result from a hypothetical oil spill in the georges bank area off massachusetts combining an oil spill risk analysis model with an hedonic pricing model to generate estimates of beach pollution costs associated with offshore oil development wilman makes possible for the first time a rational judgement regarding whether the benefits of developing offshore oil outweigh the costs this book is a valuable resource for students interested in environmental studies and wilman s methodological approach can be used to value other nonmarket resource services in any area

combining statistical analysis with well written narrative history this re evaluation of the 1928 presidential election gives a vivid portrait of the candidates and the campaign lichtman has based his study primarily on a statistical analysis of data from that election and the presidential elections from 1916 to 1940 for all the 2 058 counties outside the former confederate south not relying exclusively on the results of his quantitative analysis however lichtman has also made an exhaustive survey of previous scholarship and contemporary accounts of the 1928 election he discusses and challenges previous interpretations especially the ethnocultural and pluralist interpretations and the application of critical election theory to the election in disputing this theory which claims that 1928 was a realigning election in which the coalitions were formed that dominated future elections lichtman determines that 1928 was an aberration with little impact on later political patterns
